3. Project Design

Implement Client Script & UI Policy (Incident)

System Design

The design connects Incident form data with UI Policies and Client Scripts. Based on the Incident values, the system applies field behavior and validation.

Architecture / Flow

Incident Record → Check Conditions → UI Policy / Client Script → Apply Field Rules → Validate User Action → Save / Reject Action

UI Policy Design

UI Policy name: High Impact Control
Table: Incident
Condition: Impact is 1 - High
Configured actions include making Urgency mandatory and controlling Assignment Group visibility.

Client Script Design

Client Script name: Prevent state change via list edit
Table: Incident
Type: onCellEdit
Field: State
Purpose: Prevent State updates through list editing and display an alert message.

Module Design

The project consists mainly of Incident configuration, UI Policy configuration, UI Policy Actions, Client Script configuration, and Testing.

Design Goal

The design ensures that business rules are applied automatically at the user-interface level while maintaining controlled Incident data.
