5. Project Development

Implement Client Script & UI Policy (Incident)

Development Environment

The project was implemented in a ServiceNow instance using Incident table configuration and Client Scripts.

UI Policy Implementation

Created UI Policy 'High Impact Control' on Incident. Condition: Impact is 1 - High. UI Policy Actions were configured to make Urgency mandatory and control Assignment Group visibility.

Client Script Implementation

Created 'Prevent state change via list edit'. Table: Incident. Type: onCellEdit. Field: State. The script validates list editing and uses a callback to prevent the update when the rule is violated.

Incident Demonstration Record

The configuration was tested using Incident INC0010003. The record showed Impact as 1-High, Priority as 1-Critical, State as In Progress and Assignment Group as CAB Approval.

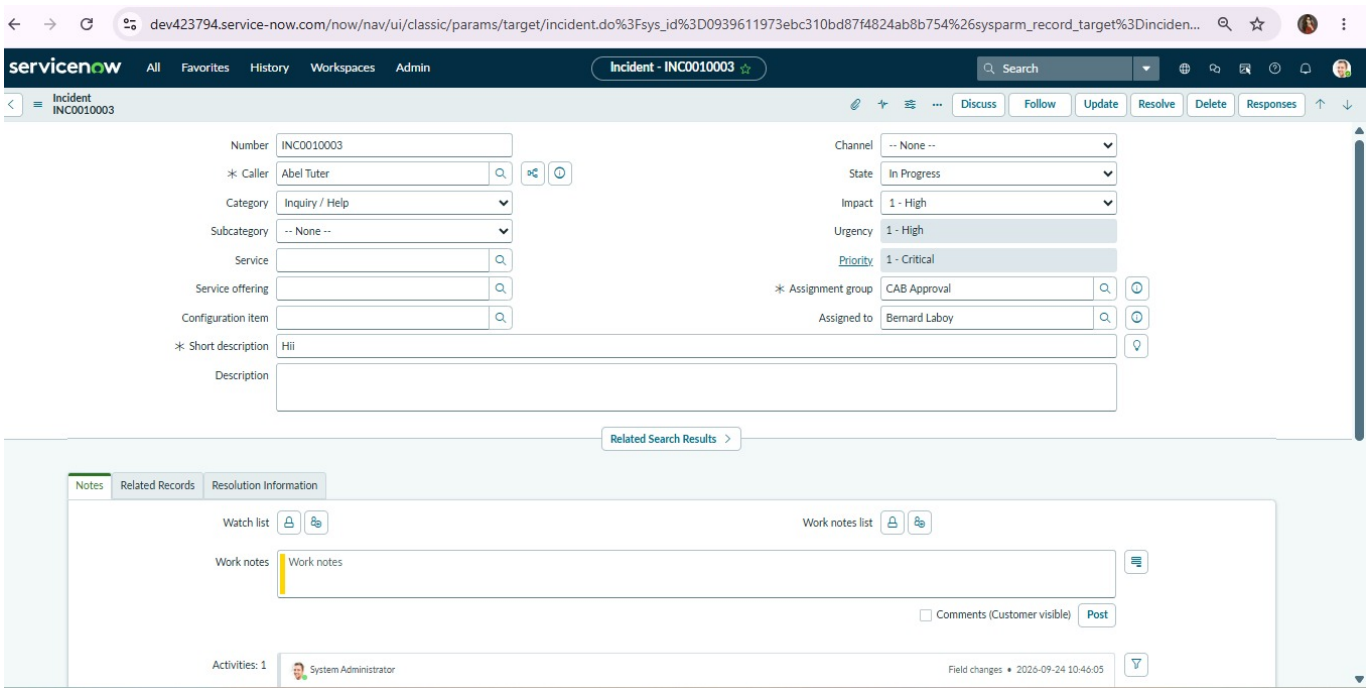

Implementation Flow

Login → Open Incident → Configure UI Policy → Configure UI Policy Actions → Create Client Script → Test Incident → Verify Result → Capture Evidence.

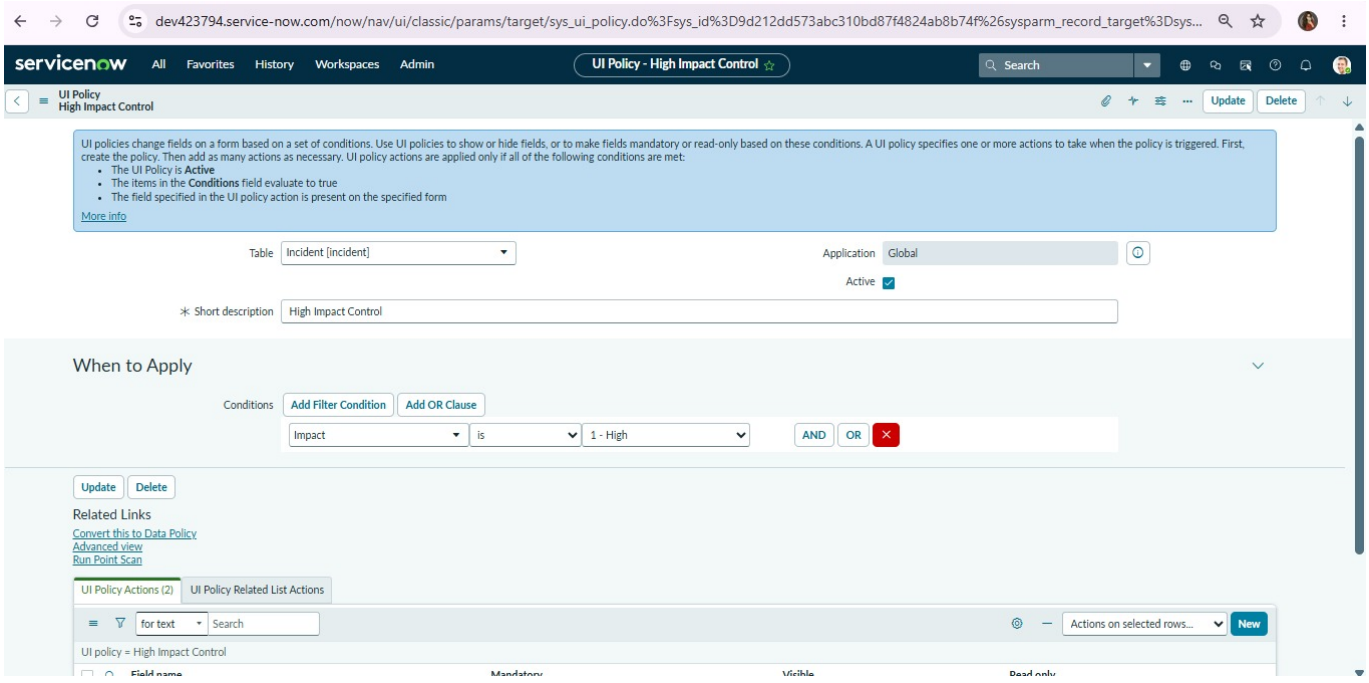

Development Result

The main UI Policy and Client Script configurations were implemented and verified in the ServiceNow environment.
